

Graph explanation architecture

What is this graph is talking about?

This diagram on the board is showing the **basic architecture of a computer system** (inspired by the Von Neumann model). Let me break it down:

- **User → Programme → Machine**

At the top, it shows that the **user** interacts with the **program**, which in turn runs on the **machine** (the computer hardware).

- **Machine = Hardware**

The machine is represented below with its components.

- **µP (Microprocessor / CPU)**

This is the central unit, which includes:

- **UAL** (*Unité Arithmétique et Logique* → ALU: Arithmetic Logic Unit)
- **UC** (*Unité de Contrôle* → Control Unit)

- **RAM (Mémoire Vive)**

The memory is represented with addresses (`0x2` , `b=5` , etc.), connected to the CPU through the **bus** (address bus + data bus).

- **E/S (Entrée/Sortie = Input/Output)**

The CPU also connects to external devices (keyboard, screen, disk, etc.) via input/output buses.

- **Bus**

The arrows labeled "bus" show the communication channels:

- **Bus d'adresses** (address bus) → tells which memory location or device to access.
 - **Bus de données** (data bus) → carries the actual data.
-

👉 So in summary:

This is a **block diagram of computer architecture**, showing how the **CPU (μP)**, **memory (RAM)**, and **I/O devices** are connected through buses, and how the **user runs programs** on the machine.

Do you want me to **redraw this clearly in a clean diagram (digital version)** so it's easier to study?
